# • HTML form without CSRF protection

Severity	Medium
Reported by module	Crawler

# **Description**

This alert may be a false positive, manual confirmation is required.

Cross-site request forgery, also known as a one-click attack or session riding and abbreviated as CSRF or XSRF, is a type of malicious exploit of a website whereby unauthorized commands are transmitted from a user that the website trusts.

Acunetix WVS found a HTML form with no apparent CSRF protection implemented. Consult details for more information about the affected HTML form.

#### **Impact**

An attacker may force the users of a web application to execute actions of the attacker"s choosing. A successful CSRF exploit can compromise end user data and operation in case of normal user. If the targeted end user is the administrator account, this can compromise the entire web application.

#### Recommendation

Check if this form requires CSRF protection and implement CSRF countermeasures if necessary.

#### Affected items

# /admin/user/regist

#### **Details**

Form name: <empty>

Form action: https://192.168.5.244/admin/user/regist

Form method: GET

# Password field submitted using GET method

Severity	Medium
Reported by module	Crawler

#### Description

This page contains a form with a password field. This form submits user data using the GET method, therefore the contents of the password field will appear in the URL. Sensitive information should not be passed via the URL. URLs could be logged or leaked via the Referer header.

#### **Impact**

Possible sensitive information disclosure.

#### Recommendation

The password field should be submitted through POST instead of GET.

#### Affected items

#### **Web Server**

Details

form name: "<unnamed>"

form action: ""

password input: "password"

#### Request headers

# O Cookie(s) without HttpOnly flag set

Severity	Low
Reported by module	Crawler

# **Description**

This cookie does not have the HTTPOnly flag set. When a cookie is set with the HTTPOnly flag, it instructs the browser that the cookie can only be accessed by the server and not by client-side scripts. This is an important security protection for session cookies.

#### **Impact**

None

#### Recommendation

If possible, you should set the HTTPOnly flag for this cookie.

# Affected items

#### **Web Server**

# File upload

Severity	Low
Reported by module	Crawler

#### **Description**

This page allows visitors to upload files to the server. Various web applications allow users to upload files (such as pictures, images, sounds, ...). Uploaded files may pose a significant risk if not handled correctly. A remote attacker could send a multipart/form-data POST request with a specially-crafted filename or mime type and execute arbitrary code.

# **Impact**

If the uploaded files are not safely checked an attacker may upload malicious files.

# Recommendation

Restrict file types accepted for upload: check the file extension and only allow certain files to be uploaded. Use a whitelist approach instead of a blacklist. Check for double extensions such as .php.png. Check for files without a filename like .htaccess (on ASP.NET, check for configuration files like web.config). Change the permissions on the upload folder so the files within it are not executable. If possible, rename the files that are uploaded.

#### Affected items

# /admin/user/import-user

# Request headers

GET / HTTP/1.1

# Login page password-guessing attack

Severity	Low
Reported by module	Scripting (Html_Authentication_Audit.script)

#### **Description**

A common threat web developers face is a password-guessing attack known as a brute force attack. A brute-force attack is an attempt to discover a password by systematically trying every possible combination of letters, numbers, and symbols until you discover the one correct combination that works.

This login page doesn't have any protection against password-guessing attacks (brute force attacks). It's recommended to implement some type of account lockout after a defined number of incorrect password attempts. Consult Web references for more information about fixing this problem.

#### **Impact**

An attacker may attempt to discover a weak password by systematically trying every possible combination of letters, numbers, and symbols until it discovers the one correct combination that works.

# Recommendation

It's recommended to implement some type of account lockout after a defined number of incorrect password attempts.

#### Possible sensitive directories

Severity	Low
Reported by module	Scripting (Possible_Sensitive_Directories.script)

#### Description

A possible sensitive directory has been found. This directory is not directly linked from the website. This check looks for common sensitive resources like backup directories, database dumps, administration pages, temporary directories. Each one of these directories could help an attacker to learn more about his target.

#### **Impact**

This directory may expose sensitive information that could help a malicious user to prepare more advanced attacks.

#### Recommendation

Restrict access to this directory or remove it from the website.

#### Email address found

Severity	Informational
Reported by module	Scanner

#### **Description**

One or more email addresses have been found on this page. The majority of spam comes from email addresses harvested off the internet. The spam-bots (also known as email harvesters and email extractors) are programs that scour the internet looking for email addresses on any website they come across. Spambot programs look for strings like myname@mydomain.com and then record any addresses found.

# **Impact**

Email addresses posted on Web sites may attract spam.

# Recommendation

Check references for details on how to solve this problem.

# References

Anti-spam techniques (https://en.wikipedia.org/wiki/Anti-spam techniques)

## Affected items

# Possible internal IP address disclosure

Severity	Informational
Reported by module	Scripting (Text_Search_Dir.script)

#### **Description**

A string matching an internal IPv4 address was found on this page. This may disclose information about the IP addressing scheme of the internal network. This information can be used to conduct further attacks.

This alert may be a false positive, manual confirmation is required.

#### **Impact**

Possible sensitive information disclosure.

#### Recommendation

Prevent this information from being displayed to the user.
